

AI WORKFLOW AUDIT AND TOOL SETUP

Internship Report

FlyRank Frontend AI Engineering Internship

Prepared by Gungun Sharma | BCA, 2nd Year

July 2026

Certificate of Completion — Reference

This report was prepared following completion of Anthropic's AI Fluency course through Anthropic Academy. A screenshot of the completion certificate is included in the accompanying Screenshots folder (Anthropic_Certificate.png) and referenced in the GitHub repository submitted alongside this report.

The course covered the 4D framework for responsible AI collaboration — Delegation, Description, Discernment, and Diligence — which forms the analytical basis for the audit presented in this document.

1. Introduction

This report documents an audit of my recurring weekly workflow as a BCA student and AI Engineering intern with FlyRank, carried out to determine which tasks genuinely benefit from AI involvement and which should remain fully under my own control. The audit was completed as part of the AI Workflow Audit and Tool Setup assignment, and applies the 4D framework — Delegation, Description, Discernment, and Diligence — from Anthropic's AI Fluency course to my own, real week rather than to a hypothetical scenario.

The deliverables produced alongside this report include a 15-task workflow audit table, a redesigned workflow for three target tasks, a configured Claude project for ongoing engineering work, and a GitHub repository documenting all of it.

2. Why AI Workflow Auditing Matters

It is easy to adopt AI tools without ever examining which tasks actually justify them. Used indiscriminately, AI can quietly erode the skills an internship is meant to build, or introduce unreviewed errors into work that carries real consequences. Used deliberately, it removes friction from the repetitive parts of the job and frees time for the parts that require judgement.

A workflow audit forces a task-by-task decision instead of a blanket policy. The output of this audit is not "use AI more" or "use AI less" — it is a specific map of which of my recurring tasks belong in which category, and why.

3. Current Weekly Workflow

My week currently splits across four areas: BCA coursework, the FlyRank internship, self-directed AI Engineering learning, and portfolio/GitHub upkeep. Mapping these out task by task was the necessary first step before any classification could happen — I had not previously separated "things I do" from "things that actually need my judgement."

- Coursework: assignments, lab write-ups, occasional viva preparation
- FlyRank internship: frontend tasks, code review, standups, documentation
- AI Engineering learning: Anthropic Academy modules, small practice projects
- DSA practice: daily problems, revisiting weak topics
- Portfolio and GitHub: commits, README upkeep, repository structure

4. Workflow Audit Table

The table below classifies 15 recurring tasks from my weekly workflow using four categories: Just Me, Collaborate with AI, Delegate to AI with Review, and Fully Automate. The full spreadsheet version is included in the repository under Deliverables/Workflow_Audit_Table.xlsx.

Task	Freq.	Current Method	AI Classification	Reason	Est. Time
Frontend component boilerplate (React)	Daily	Manual (VS Code)	Delegate + Review	Repetitive, well-specified, low risk once reviewed	45 min
Debugging syntax/runtime errors	Daily	Manual trial & error	Collaborate	Needs context; AI narrows likely cause faster	30 min
Writing commit messages	Daily	Manual	Fully Automate	Formulaic, low risk, trivial to fix	5 min
README / documentation drafting	Weekly	Manual writing	Delegate + Review	Fast first draft; must verify against actual code	60 min
DSA problem solving (practice)	Daily	Self only	Just Me	Practice value is lost if automated	45 min
DSA solution review after attempt	Daily	Self only	Collaborate	AI reviews only after I've solved it myself	15 min
Lecture / course notes formatting	Weekly	Manual (Notion/Word)	Delegate + Review	Repetitive structuring; accuracy checked manually	40 min
Code review comments (FlyRank tasks)	Weekly	Self review	Collaborate	Needs domain judgement; AI catches oversights	30 min
Standup / status update drafting	Daily	Manual	Delegate + Review	Repetitive format, factual content verified	10 min
Project planning / task breakdown	Weekly	Manual to-do list	Collaborate	Needs prioritisation judgement specific to my goals	30 min
GitHub repository cleanup	Weekly	Manual	Delegate + Review	Structural, low risk, easy visual check	20 min
Anthropic Academy course notes	Weekly	Manual	Just Me	Learning-critical; writing builds retention	60 min
Test case writing for components	Weekly	Manual	Collaborate	AI drafts cases; I decide real coverage needs	40 min
Formatting / proofreading reports & emails	Weekly	Manual	Delegate + Review	Repetitive, low risk, quick to verify	20 min
Repetitive CSS / styling boilerplate	Weekly	Manual	Fully Automate	Highly repetitive, visually verifiable, low risk	30 min

Classification	Meaning
Just Me	Task requires human judgement, learning, or accountability throughout. No AI delegation.
Collaborate with AI	Iterative back-and-forth; AI assists but I remain actively in the loop on decisions.
Delegate to AI with Review	AI produces a first pass; I review and approve before treating it as final.
Fully Automate	Low-risk, well-defined, repetitive task; AI output used with minimal per-instance review.

5. Detailed Workflow Analysis

5.1 Current Bottlenecks

- Boilerplate-heavy tasks (component scaffolding, repetitive CSS) consume disproportionate time relative to their difficulty.
- Documentation is consistently written after the fact, under time pressure, which lowers its quality.
- Context-switching between coursework, internship tasks, and self-study fragments deep work time.
- No consistent verification habit existed before this audit — AI output and my own drafts were both reviewed inconsistently.

5.2 Opportunities

- Delegating well-specified, low-risk tasks (boilerplate, formatting, first-draft documentation) frees time for higher-judgement work.
- Using AI to review my own DSA solutions after attempting them, rather than before, preserves the learning value of practice.
- A standing Claude project with persistent instructions removes the need to re-explain context every session.
- A monthly re-audit turns this from a one-time report into an ongoing habit.

6. Ethical AI Usage

Two boundaries guided every classification in this audit. First, tasks where the process itself builds a skill I still need — DSA practice, and coursework meant to test my own understanding — stay in the "Just Me" category regardless of how much time AI could save. Second, anything submitted under my name to FlyRank or my college gets a final human review pass before it goes out, regardless of how it was drafted.

These boundaries are not about distrust of AI output — most of it, reviewed, has been reliable. They exist because responsibility for the final result stays with me, not with the tool.

7. Responsible AI Practices

- Transparency: this report itself discloses where AI assisted in drafting versus where the underlying judgement is mine (see `Submission_Notes.txt`).
- Proportional review: verification effort scales with the task's risk, not with how tedious it feels.
- No delegation of learning-critical work: DSA practice and graded coursework stay manual by design.
- Documented reasoning: every classification in the audit table includes a stated reason, not just a label.

8. Claude Project Configuration

8.1 Project Name

FlyRank AI Engineering Internship

8.2 Project Description

A persistent workspace for internship-related engineering work — frontend code assistance, documentation drafting, and workflow analysis — configured so that recurring context (my role, my stack, my review habits) doesn't need to be re-explained in every conversation.

8.3 Custom Instructions

- Treat me as a BCA 2nd-year student and AI Engineering intern; explain reasoning, not just answers, for anything code-related.
- For coding tasks, prefer clear and readable solutions over clever ones, and flag any assumptions made.
- For documentation and reports, keep language direct and specific — avoid generic filler.
- Default to giving a first draft I can review and edit, rather than a final answer presented as complete.

8.4 Expected Outcomes

- Faster first drafts for boilerplate code and documentation, with review remaining my responsibility.
- Consistent formatting and tone across recurring deliverables (standups, READMEs, reports).
- A running record of AI-assisted work for this internship, supporting the transparency goals above.

9. Anthropic AI Fluency Completion

The AI Fluency course was completed through Anthropic Academy. A full written summary of the course — covering generative AI fundamentals, the 4D framework, prompt engineering, and responsible AI practices — is included in the repository under `Notes/AI_Fluency_Summary.md`. The completion certificate is included as a screenshot in the Screenshots folder.

10. GitHub Setup

This audit is published as a standalone repository (AI-Workflow-Audit) structured for clarity: a top-level README, an MIT license, and separate folders for the report, working notes, deliverables, and supporting assets. The repository structure and a screenshot of the live GitHub repository are included in this submission.

- README.md documents the project overview, tools used, and folder structure.

- Report/, Notes/, Deliverables/, and Submission/ separate the polished output from working material.
- A .gitignore excludes OS and editor artifacts to keep the repository clean.

11. AI Tool Setup

11.1 Claude

Primary tool for coding assistance, documentation drafting, and workflow analysis, used through a dedicated Claude project configured with persistent instructions for this internship.

11.2 ChatGPT

Used occasionally for quick syntax lookups and as a second opinion when comparing approaches, but not as the primary workflow tool for this internship.

11.3 GitHub

Used for version control and for hosting this audit as a public, reviewable repository.

11.4 VS Code

Primary editor for all code and Markdown files produced during the internship and this audit.

11.5 Anthropic Academy

Source of the AI Fluency course that underpins the classification framework used throughout this report.

11.6 AI Fluency Certificate

Completion certificate obtained on finishing the AI Fluency course; included as a screenshot in the Screenshots folder and referenced in Section 9.

12. Workflow Improvements

Based on the audit, the following changes have been adopted going forward: boilerplate and formatting tasks move to "Delegate with Review" or "Fully Automate"; documentation drafting starts earlier in the work cycle using AI-assisted first drafts instead of being written from scratch at the end; and DSA practice and course notes stay fully manual, with AI only used for review after the fact.

13. Three Target Tasks

Three tasks were selected for a full workflow redesign: AI-assisted coding, documentation, and project planning. Each is expanded in detail in Deliverables/Three_Target_Tasks.docx; a summary is below.

Task	Current Workflow	Future Workflow	Key Improvement
AI-Assisted Coding	Write all code manually, debug ad hoc	Draft with AI, review + test before merge	Reduced review-cycle time, fewer boilerplate errors
Documentation	Written after the fact, often rushed	AI first draft during development, human fact-check	Docs stay current, less end-of-sprint scramble
Project Planning	Informal to-do list, reactive prioritisation	AI-assisted breakdown reviewed against real deadlines	Clearer priorities, fewer missed dependencies

14. Key Learnings

- AI classification is not binary — most real engineering tasks land in "Collaborate" or "Delegate with Review," not the extremes.
- Description quality determines output quality more than prompt length or cleverness.
- Verification is a distinct, learnable skill, separate from knowing how to prompt well.
- The tasks most tempting to fully automate (documentation, boilerplate) are also where unreviewed errors are easiest to miss.

15. Personal Reflection

Going into this audit, I expected to end up recommending more AI use across the board. Instead, the more specific outcome was a map of exactly where AI helps and where it doesn't, task by task, rather than a general verdict.

What surprised me most was how much the quality of my own instructions mattered. When I described a task vaguely, I got back something generic that I then had to rewrite anyway — which cost more time than doing it myself. When I described the actual goal, the constraints, and what "done" looked like, the first draft was usually close enough that reviewing it was quick. That difference alone reframed how I think about delegation: it isn't a switch I flip, it's a description I have to get right.

I also noticed where AI should not replace my own thinking. DSA practice is the clearest example — if I ask for the answer before attempting a problem, I finish the problem but not the learning. The same is true for parts of my coursework that exist specifically to test whether I understand something, not whether I can produce a correct-looking answer. Those tasks stayed in the "Just Me" column throughout the audit, and I don't expect that to change as my skills grow, even if the specific tasks in that column do.

My actual day-to-day workflow changed in one concrete way: I stopped asking AI to "do" a task and started asking it to handle a specific, well-defined part of a task, while I kept the parts that required context only I had — my deadlines, my code, my understanding of what "correct" meant for that specific case. That shift improved both the usefulness of the output and how much I retained from doing the work myself.

Going forward, I plan to keep the Claude project configured for this internship active and re-run this audit at the end of each month, rather than treating it as a one-time submission. I also want to build a small habit of logging actual time spent on recurring tasks, so future versions of this table are based on measured data instead of estimates. The biggest value of this assignment wasn't the report itself — it was building a framework I can keep using after the internship ends.

16. Future Roadmap

- Re-run the workflow audit monthly and track how classifications shift as my skills develop.
- Add a lightweight time-tracking log to replace estimated times with measured ones.
- Build a small library of saved prompt templates for the three target tasks inside the Claude project.

- Extend the audit to cover team-facing FlyRank workflows as my responsibilities grow.

17. Conclusion

This audit replaced a vague sense of "I should probably use AI more" with a specific, reasoned map of fifteen recurring tasks, each classified and justified individually. The resulting workflow keeps learning-critical work in my own hands, moves genuinely repetitive and low-risk work to AI with appropriate review, and treats verification as a required step rather than an afterthought. The Claude project, the completed AI Fluency course, and this GitHub repository together give me a working setup I can continue using for the rest of the internship, not just a one-time deliverable.

18. Appendix

A. Repository Structure

The complete folder structure, including the report, notes, deliverables, and screenshots, is documented in README.md at the root of the AI-Workflow-Audit repository.

B. Supporting Files

- Notes/Workflow_Notes.md — working notes behind this report
- Notes/AI_Fluency_Summary.md — full course summary
- Deliverables/Workflow_Audit_Table.xlsx — full audit spreadsheet
- Deliverables/Three_Target_Tasks.docx — detailed redesign of three tasks
- Submission/Submission_Notes.txt — notes for the reviewer
